COMPREHENSIVE TRAINING REPORT

Subject Code: ES-453 (7th Semester)

Design and Development of Interactive Data Visualisation Modules for a Solar PV Smart O&M Monitoring Portal

Submitted in partial fulfilment of the
Requirements for the award of

Degree of Bachelor of Technology in Information Technology

Submitted By:
Name of Student: ***Ishan Bhattacharya***
Enrollment No.: ***08514803123 (7I4)***

Under the Guidance of:
Faculty Guide: ***Sunil Maggu***
Industry Mentor: ***Mr. Manav Gupta, PV Doctor Pte. Ltd.***
Head of Department: ***Prof. (Dr.) Amita Goel***

SUBMITTED TO:

Department of Information Technology
MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
GGSIPU, DELHI

Academic Session 2026–27

6. **Appendix K – SDG Mapping.....52**

CERTIFICATE BY COMPANY

Internship certificate issued by PV Doctor Pte. Ltd. on its letterhead (4 September 2026).

PV DOCTOR
Asset Management

18 Cross Street
#02-101, 18 Cross
Singapore 048423
UEN: 202443177E

INTERNSHIP CERTIFICATE

4 September 2026

TO WHOM IT MAY CONCERN

This is to certify that Mr. Ishan Bhattacharya completed an internship with PV Doctor Pte. Ltd. as a Data Analytics Intern from 5 May 2026 to 31 August 2026.

During this period, he was attached to the Data Engineering and Analytics Department, where he was assigned tasks related to data engineering and analytics. Mr. Ishan Bhattacharya demonstrated a positive attitude and a willingness to learn throughout his internship tenure. He engaged with the team professionally and approached his responsibilities with enthusiasm.

We acknowledge his efforts during his time with us and wish him well as he continues to develop his skills and grow in his career.

Sincerely,

Dannila Choong
Head of Finance & General Affairs

DECLARATION

I hereby declare that the Training Report entitled "Design and Development of Interactive Data Visualisation Modules for a Solar PV Smart O&M Monitoring Portal" is an authentic record of my own work as requirements of 17 weeks Training during the period from 5 May 2026 to 31 August 2026 for the award of degree of B.Tech. (Information Technology), GGSIPU, under the guidance of Mr. Manav Gupta, Head of Data Engineering & Analytics, PV Doctor Pte. Ltd., Singapore.

Signature of Student: Ishan Bhattacharya

Name of Student: Ishan Bhattacharya

University Roll No.: 08514803123

Date: 12 October 2026

Certified that the above statement made by the student is correct to the best of our knowledge and belief.

Examined by:

1. _____ 2. _____

Industry Mentor (Mr. Manav Gupta) Faculty Counsellor (Sunil Maggu)

Head of Department (Signature and Seal): _____

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to PV Doctor Pte. Ltd., Singapore, for giving me the opportunity to work as an intern in its Data Engineering & Analytics team from May to August 2026. Working on a live product used by solar asset owners in more than twenty countries was the most valuable learning experience of my degree so far.

I am deeply thankful to my industry mentor, Mr. Manav Gupta, Head of Data Engineering & Analytics, who guided my work throughout the internship, reviewed every pull request patiently and explained the reasoning behind each design decision. I also thank Dr. André Nobre, Managing Director, and Ms. Dannila Choong, Head of Finance & General Affairs, for their support with the internship formalities, and all members of the team who answered my questions about solar performance analysis and the portal codebase.

I am grateful to Prof. (Dr.) Amita Goel, Head of the Department of Information Technology, Maharaja Agrasen Institute of Technology, Mr. Ajay Kumar Kaushik, Summer Training Coordinator, and my Faculty Counsellor, Sunil Maggu, for their guidance on the ES-453 training process and this report.

Finally, I thank my family and friends for their constant encouragement.

Ishan Bhattacharya

University Roll No.: 08514803123

ABOUT THE COMPANY

PV Doctor Pte. Ltd. is a Singapore-based Asset Performance Management (APM) provider for solar photovoltaic (PV) and battery energy storage (BESS) systems. The company was incorporated on 21 October 2024 (UEN 202443177E) and is headquartered at 18 Cross Street, #02-101, Singapore 048423. Its stated mission is to act as the "trusted care-taker" of a PV asset: it listens to the problems of an under-performing system, analyses the data to find root causes, and stays with the client until the system is rectified and back to optimum performance.

Services

- **Smart O&M and Data Analytics** – continuous remote monitoring of PV systems through the Smart O&M Portal, daily performance reports, KPI-based alarms and analytics.
- **Preventive O&M** – scheduled inspections and maintenance planning driven by monitoring data.
- **Rectifications & Investigations** – root-cause analysis of under-performance and support until the fault is fixed.
- **Repowering Services** – upgrading ageing or damaged PV systems.
- **Audits & Performance Assessments** – independent technical audits of PV plants.
- **Technical Analytics** – custom studies such as degradation, soiling and yield analyses.

Scale and Growth

According to the company's public website, PV Doctor manages more than 2.5 GWp of PV capacity across over 2,600 systems in about 25 countries (as of September 2026). Its clients range from residential owners to commercial and industrial rooftops, utility-scale solar farms, floating systems, educational and government institutions, and a large international pharmaceutical company. Figure 1 shows how quickly the managed capacity has grown since the company began operating in 2024.

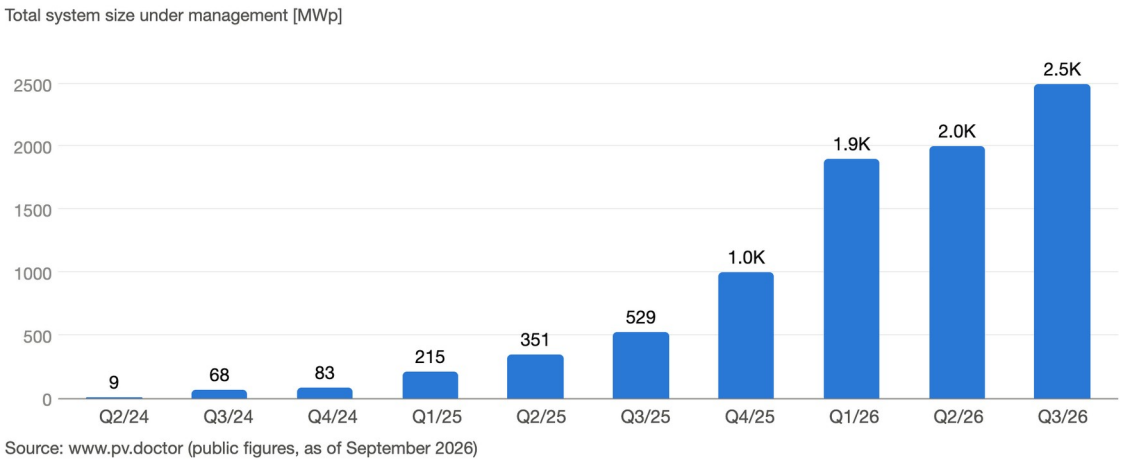

Figure 1: Growth of PV capacity managed by PV Doctor (Q2 2024 – Q3 2026)

Organisation

The company is led by its Managing Director, Dr. André Nobre. Interns and staff work in functional teams that include Business Development, Systems Engineering, IT & Data Services, Performance Engineering, Artificial Intelligence, and Data Engineering & Analytics (DEA). I was attached to the **Data Engineering & Analytics** team, which owns the data pipelines and the Smart O&M Portal (portal.pv.doctor), reporting to the Head of Data Engineering & Analytics. The team works remotely across Singapore, India and other countries and coordinates through Jira, code reviews and regular online meetings.

ABBREVIATIONS AND NOMENCLATURE

Table 2: Abbreviations and symbols

Abbreviation / Symbol	Meaning
AC	Alternating Current
API	Application Programming Interface
APM	Asset Performance Management
BESS	Battery Energy Storage System
CM / LT / LY	Current Month / Lifetime / Last Year (period filters)
CoV	Coefficient of Variation
CSS	Cascading Style Sheets
GHI	Global Horizontal Irradiance
G1 / G2 / G3	Graph groups on the Inverter / MFM monitoring page
INV	Inverter
KPI	Key Performance Indicator
kWh/kWp	Specific yield – energy per installed peak kilowatt
MFM	Multi-Function Meter (energy meter)
MWp / GWp	Megawatt-peak / Gigawatt-peak (installed DC capacity)
O&M	Operations and Maintenance
PNG	Portable Network Graphics (image export)
POA	Plane of Array (irradiance on module plane)
PR	Performance Ratio
PV	Photovoltaic
REST	Representational State Transfer
SDG	Sustainable Development Goal
SQL	Structured Query Language
STC	Standard Test Conditions (1000 W/m², 25 °C)
UI / UX	User Interface / User Experience
H	In-plane irradiation over a period (kWh/m²)
E	AC energy delivered over a period (kWh)
P_0	Installed DC capacity of the system (kWp)
σ, μ	Standard deviation and mean of a set of values

CHAPTER 1
INTRODUCTION

1.1 Background

Solar photovoltaic capacity is growing faster than any other source of electricity. India alone has more than 25 GW of rooftop solar and several lakh new household systems every year, and South-East Asian countries are adding utility-scale and commercial rooftop plants at a similar pace. Once a plant is built, however, its output depends on how well it is operated. Faults such as inverter trips, string failures, soiling, shading and communication loss can silently reduce generation for weeks if nobody is watching the data.

Asset Performance Management companies such as PV Doctor solve this problem with continuous remote monitoring. Data from inverters, energy meters (MFMs) and weather stations is collected every few minutes, stored in a central database and converted into Key Performance Indicators (KPIs) such as specific yield, Performance Ratio (PR) and Coefficient of Variation (CoV). Engineers and asset owners then use a web portal to see which plants and which devices are under-performing and why.

The usefulness of such a portal depends heavily on its visualisations. A chart with wrong units, a date filter that silently drops a month, or a tooltip that is cut off at the edge of the screen can mislead an engineer and delay a repair. My internship was focused on exactly this layer: building and refining the interactive charts, filters and data views of PV Doctor's Smart O&M Portal, and the backend APIs that feed them.

1.2 About the Training

Table 3: Internship details

Item	Details
Organisation	PV Doctor Pte. Ltd., Singapore
Team	Data Engineering & Analytics
Designation	Data Analytics Intern (Web Development of the Monitoring Portal)
Duration	5 May 2026 – 31 August 2026 (17 weeks)
Mode	Remote (work from home, India)

Item	Details
Working hours	9 am – 6 pm, Monday to Friday until 31 July; about 4 hours per day in August
Stipend	INR 20,000 per month
Project	Design and Development of Interactive Data Visualisation Modules for a Solar PV Smart O&M Monitoring Portal

The internship agreement (Appendix A of the agreement) defined the scope of work as: designing and developing PV Doctor's Monitoring Portal, including dashboards and core user interface components; building responsive front-end applications in React with data-visualisation libraries; integrating the front end with backend services powered by FastAPI; following clean-architecture principles with attention to performance, scalability and reliability; and taking end-to-end ownership of assigned features from requirement analysis to delivery. The original term was 5 May to 31 July 2026; it was extended to 31 August 2026 on a part-time basis, as recorded in the company's internship certificate.

1.3 Objectives

- Understand the solar PV monitoring domain – the meaning of yield, irradiation, PR, CoV and corridor analysis – well enough to present them correctly.
- Build and improve interactive charts for plant-level and device-level monitoring (Daily Generation, Irradiation vs Yield, PR Evolution, Yield–PR scatter, CoV, Heatmap, Stacked Bar, Spatial Heatmap).
- Make period and date-range filtering correct and consistent across all modules.
- Reduce duplicated code by refactoring chart implementations into shared components.
- Extend the FastAPI backend for System Information, Raw Data, reference sensors and satellite (SolarGIS) data, with attention to query performance.
- Follow professional software practice: Jira tasks, feature branches, pull requests, code review, staging verification and automated tests.

1.4 Scope of this Report

Company source code, client names, credentials and datasets are confidential under the internship agreement. This report therefore describes the work at the level of features, design decisions and algorithms, uses generic descriptions instead of client site names, and uses the public material from portal.pv.doctor and the company website for illustrations.

1.5 Organisation of the Report

Chapter 2 describes the tools and technologies used. Chapter 3 presents the technical work module by module. Chapter 4 contains screenshots and visuals of the portal. Chapter 5 discusses the results and challenges, and Chapter 6 concludes with future scope. The weekly jobs summary, learning outcomes, references and the prescribed appendices (weekly logbooks, feedback forms, exit survey, CO–PO/PSO and SDG mapping) follow.

CHAPTER 2

TOOLS & TECHNOLOGY USED

The Smart O&M Portal is a full-stack web application. The front end is a Next.js application written in TypeScript, the back end is a Python FastAPI service, and data is stored in a SQL Server database. Both services run behind Nginx on a Linux server, with separate production and staging instances managed by systemd. Figure 2 shows the overall architecture.

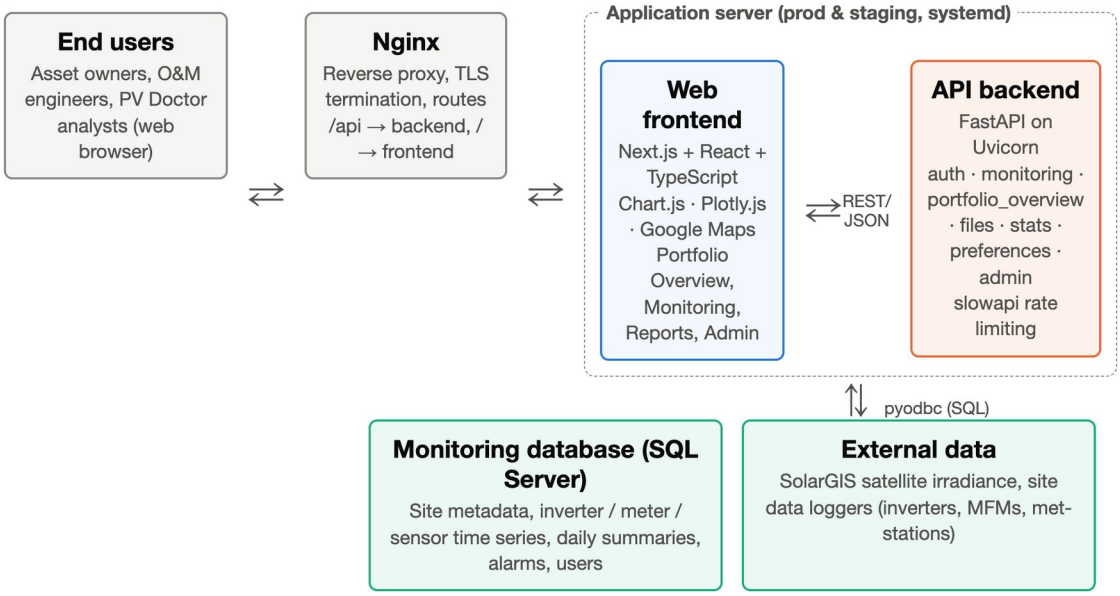

Figure 2: High-level architecture of the Smart O&M Portal

2.1 Front-end Technologies

Table 4: Front-end technologies

Technology	Purpose in the project
Next.js (App Router)	React framework used for routing (portfolio-overview, monitoring, reports, admin, profile), layouts and production builds.
React	Component model for charts, filters, tables and panels; hooks and context for user, client and preference state.
TypeScript	Static typing of API responses, chart data and component props; catches errors before runtime.
Chart.js 4	Main charting library for bar, line and scatter charts (generation, yield, PR, CoV, stacked bars).
chartjs-plugin-zoom	Zoom and pan behaviour, restricted to the X-axis where needed.

Technology	Purpose in the project
chartjs-adapter-date-fns / date-fns	Time axes and date arithmetic for period filters (CM, LT, LY, custom ranges).
Plotly.js (react-plotly.js)	Heatmaps and interactive visualisations that need colour scales and hover detail.
Google Maps JavaScript API	World map in Portfolio Overview and satellite layer for the Spatial Heatmap.
SheetJS (xlsx)	Client-side Excel export of tables and chart data.
CSS Modules	Component-scoped styling, responsive breakpoints and theming.
lucide-react, lottie-react	Icons and lightweight animations.

2.2 Back-end Technologies

Table 5: Back-end technologies

Technology	Purpose in the project
Python 3 + FastAPI	REST API with route modules: auth, monitoring, portfolio_overview, files, stats, preferences, contact, health, admin.
Uvicorn	ASGI server running the FastAPI application.
pyodbc + SQL Server	Database access for site metadata, device time series, daily summaries, alarms and users.
slowapi	Rate limiting of API endpoints by client address.
itsdangerous, python-dotenv	Signed tokens and environment-based configuration (no secrets in code).
SolarGIS data	Satellite-derived irradiance used as a reference when on-site sensors are missing or unreliable.
Automated tests	API tests for auth, files, contact, health, preference and stats modules (added in week 17).

2.3 Deployment and Collaboration Tools

Table 6: Deployment and collaboration tools

Tool	Use
Git & GitHub	Version control, feature branches and pull requests with code review.
Jira (Atlassian)	Task tracking for feature requests and review comments.
Nginx	Reverse proxy for the web and API services of portal.pv.doctor.

Tool	Use
systemd	Service units for production and staging (web and API).
VS Code	Development environment.
Chrome DevTools	Debugging layout, network calls and performance in the browser.
Microsoft Excel	Verifying exported data and maintaining the intern task tracker.
Google Meet / chat	Daily communication with the remote team.

2.4 Domain Concepts

Correct visualisation requires correct domain understanding. The following KPIs, defined in the IEC 61724-1 standard for PV performance monitoring, appear throughout the portal:

- **Specific (final) yield**: $Y_f = E / P_0$ [kWh/kWp] – energy produced per kilowatt-peak installed; allows plants of different sizes to be compared.
- **Reference yield**: $Y_r = H / G_{STC}$ [h] – in-plane irradiation divided by the STC irradiance of 1 kW/m²; the number of 'peak sun hours'.
- **Performance Ratio**: $PR = Y_f / Y_r \times 100\ \%$ – the share of the theoretically available energy actually delivered; typically 75–85 % for a healthy plant.
- **Coefficient of Variation**: $CoV = \sigma / \mu \times 100\ \%$ – computed across inverters or meters of a site; a high CoV means some devices are performing differently from their peers.
- **Corridor** – an expected band for PR or yield derived from historical behaviour; points outside the corridor indicate abnormal performance and can raise alarms.
- **Irradiation vs irradiance** – irradiance is instantaneous power (W/m²); irradiation is energy over time (kWh/m²). The portal labels were corrected to use the right term.
- **CO_2 avoided** – energy generated multiplied by a grid emission factor; shown per site in Portfolio Overview.

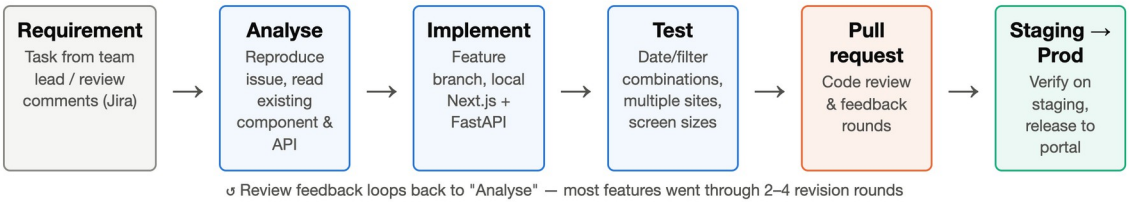

Figure 3: Development workflow followed for every task

Every task followed the workflow in Figure 3: requirement from Jira or a review comment, analysis of the existing component and API, implementation on a feature branch, testing across date ranges, sites and screen sizes, a pull request reviewed by the team, and verification on staging before release.

CHAPTER 3

TECHNICAL CONTENTS – WORK PERFORMED

This chapter describes the work module by module. Figure 4 shows the structure of the portal and where each module sits. For every module, the problem, the approach and the implementation are described.

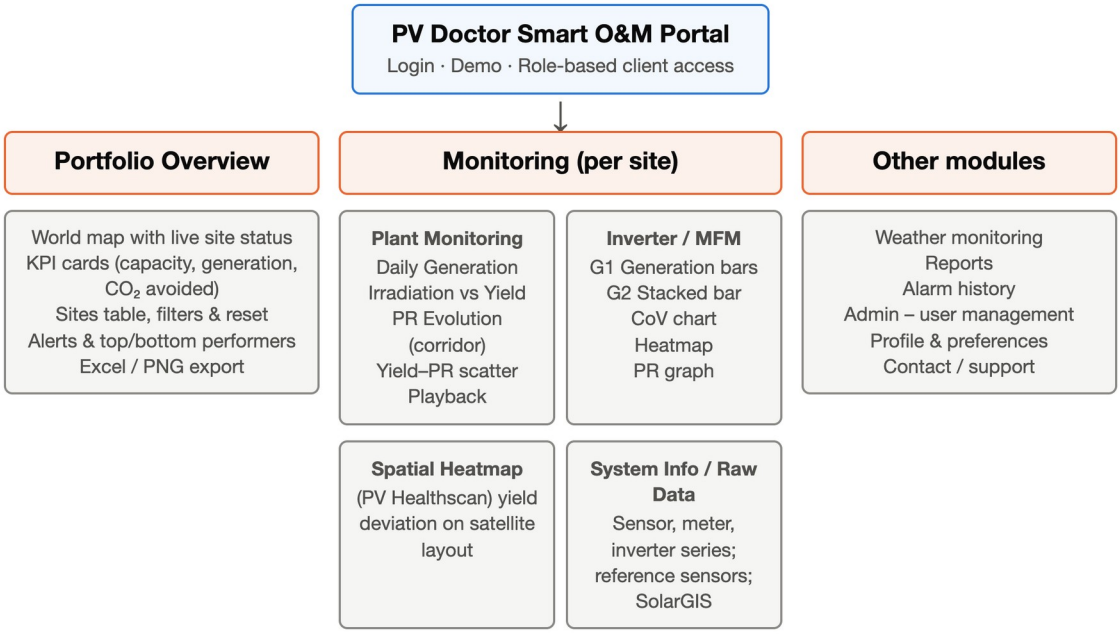

Figure 4: Module structure of the Smart O&M Portal

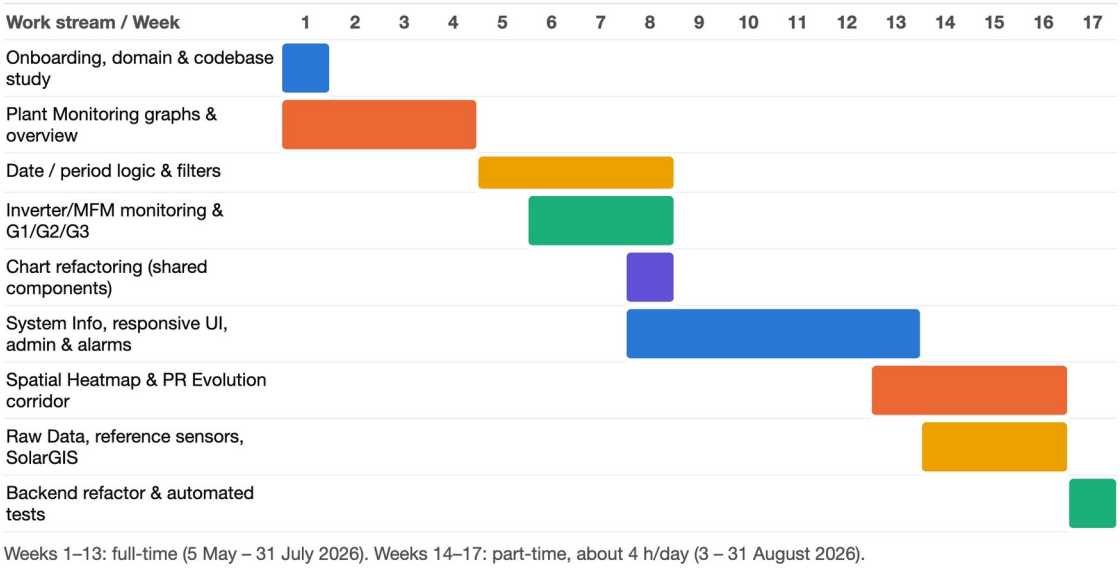

Figure 5: Timeline of work streams across the 17 weeks

3.1 Onboarding and Domain Study (Week 1)

The first days were spent getting access to Jira and the code repository, setting up the frontend (Next.js development server) and backend (FastAPI with Uvicorn) locally, and reading through the existing modules. In parallel I studied the PV KPIs listed in Section 2.4 and the IEA PVPS 'Trends in Photovoltaic Applications' material shared within the team, so that I could judge whether a chart was showing the right quantity in the right unit.

3.2 Plant Monitoring Graphs (Weeks 1–4)

The Plant Monitoring page shows site-level performance through four main charts: Daily Generation (bar), Irradiation vs Yield (combined bar/line), PR Evolution (scatter with moving average and corridor) and a Yield–PR scatter. The first month was spent bringing these charts to production quality through several rounds of review.

3.2.1 Chart controls and menus

- Moved download options into a vertical three-dot menu to the right of the chart toggles; downloads follow a fixed file-naming convention.
- Limited zoom to levels 0–9 and stacked the zoom-in, zoom-out and reset buttons vertically with semi-transparent styling, later made more opaque after feedback.
- Added a buffer above bars when the average line reaches or exceeds the y-axis limit, and blank space on the right of bar graphs, so labels are never clipped.
- Removed redundant 'period' and 'type' labels from chart headers and moved units into the column titles.

3.2.2 Tooltips, units and precision

Tooltips were redesigned: keys left-aligned in white, values right-aligned in the accent colour, with the date shown in a consistent format. Units were corrected – yield in kWh/kWp, generation in kWh, irradiation in kWh/m² – and 'irradiance' was renamed 'irradiation' where energy over time is shown. Precision rules were fixed: two decimals for yield and irradiation, one decimal for daily generation, thousand separators for large values.

3.2.3 Multi-year analysis, regression and playback

- Added a **year filter**: each year is drawn in a different shade of blue; deselected years become transparent instead of disappearing, so the axis does not jump. In the PR graph, past years are grey.
- Drew the **regression line** in red and limited the PR y-axis to 100 % with blank space above.
- Built a **playback** feature that animates the yield chart over time, with speed selection from a dropdown, chevron controls and a date indicator.
- Added a **screenshot effect** – a camera-shutter style flash on the chart border when the chart is captured as an image.

3.2.4 Corridor and layering fixes

In PR Evolution, all points inside the corridor are coloured while points outside are shown in grey in the irradiation chart; the colour bar was toned down without changing its structure; the moving-average line was given a higher z-order and greater width so it stays visible above the scatter; and a bug where the PR Evolution chart was drawn beneath the full-width Plant Monitoring section was fixed. Daily Generation was changed to plot generation (kWh) instead of yield, with Current Year as the default and a working Lifetime (LT) view.

3.3 Portfolio Overview (Weeks 2–4, 7)

Portfolio Overview is the landing page after login: a world map with every site coloured by status, KPI cards, a sites table, an alert panel and top/bottom performers. My work on this page included:

- When several sites are selected, the map bounds are recomputed so that all selected points are visible; the default view shows the whole portfolio.
- Fixed tooltip cut-off and out-of-bounds behaviour on the map, reduced the search box size and made the Reset button bolder.
- Export of the map overview to **Excel** (with separate latitude and longitude columns and the system code) and to **PNG** (map, buffer and title).
- Made **Reset** clear the component state as well as the selected filters, so map filters, table and KPIs stay synchronised.

- Fixed decimal precision and rounding in the Portfolio Overview metrics and in the Spatial Heatmap tooltips.
- Added rules to hide sensitive sections for **demo accounts**, which are used to show the portal to prospective clients.
- Improved the responsive layout of the Overview KPI cards for small screens by adjusting breakpoints (week 9).

3.4 Period Filter and Date-Range Logic (Weeks 5–8)

Many bugs reported by users came from inconsistent handling of time periods across charts. For example, selecting 'Current Month + 2026' in Daily Generation displayed only June, and the Hindsight view showed only the last month of the selected year. I corrected the period-selection logic and then defined explicit rules, agreed with the team, so that every chart behaves the same way. Table 7 summarises them.

Table 7: Period and date-range rules

Selection	Rule implemented
Today / Yesterday / single date	Show intraday data; date label format 'D' (day); Heatmap behaviour matched to CoV.
Current Month (CM)	Daily values of the current month; label 'CM'.
Last Year (LY) / single year	Show the full range of that year only; no extra sub-filters.
Lifetime (LT)	Whole history of the site; label 'LT' instead of 'All years'.
Custom range (two dates)	Default to LT granularity with a dropdown to change it.
Custom range of a single day	Default to the last 30 days (30D) with a dropdown.
Custom range < 365 days spanning two years	Monthly aggregation with Month + Year labels.
Only one option available	Hide the filter instead of showing a dropdown with a single entry.

I also restricted PR Evolution zoom to the X-axis, fixed the CoV monthly X-axis, and later (week 14) synchronised date handling across PR Evolution, Raw Data and Spatial Heatmap so that the same period means the same dates everywhere. In week 8 the System Information view was connected to the Period Filter, which required changes in the backend monitoring route to support custom access levels; this was tested end-to-end across multiple sites and user roles.

3.5 Inverter and Meter (MFM) Monitoring (Weeks 3, 6–8)

Device-level monitoring compares inverters and energy meters of the same site. Charts are organised in groups G1 (generation bars), G2 (stacked bar) and G3 (PR/CoV/heatmap). Work on this page included:

- Making the Inverter page consistent with Plant Monitoring: zoom instead of clipping, separate (not joined) grids, the same subtle grid style and axis formatting.
- Inverter uniformity chart with legends outside the plot and the green / yellow / red thresholds always visible.
- **Multi-select filters** for inverters and MFMs with a Reset action, auto-width based on selected text, and a compact 'All MFMs' label; G1/G2/G3 attached to the filters.
- Heatmap revisions: heatmap aligned with its colour bar, 'Legend' renamed 'Thresholds', legend split into two parts, consistent fonts.
- CoV chart: legend height equal to chart height, point size adapting to the Year/Day toggle, divider lines removed.
- Yield–PR graph: a Year/Day toggle, corrected Y-axis, higher z-order for selected items, and a fix for marker symbols (+, ×, *) that disappeared in some conditions.

3.6 Refactoring Chart Components (Week 8)

The Inverter and Meter pages had separate copies of the CoV chart, the Heatmap and the G2 Stacked Bar Chart. Every fix had to be made twice and the two copies had started to drift apart. I refactored the three chart types into shared components that take the entity type (inverter or meter) and data as configuration, re-implemented Heatmap Playback on top of the shared component, tested all scenarios and raised the pull request. Figure 6 shows the change.

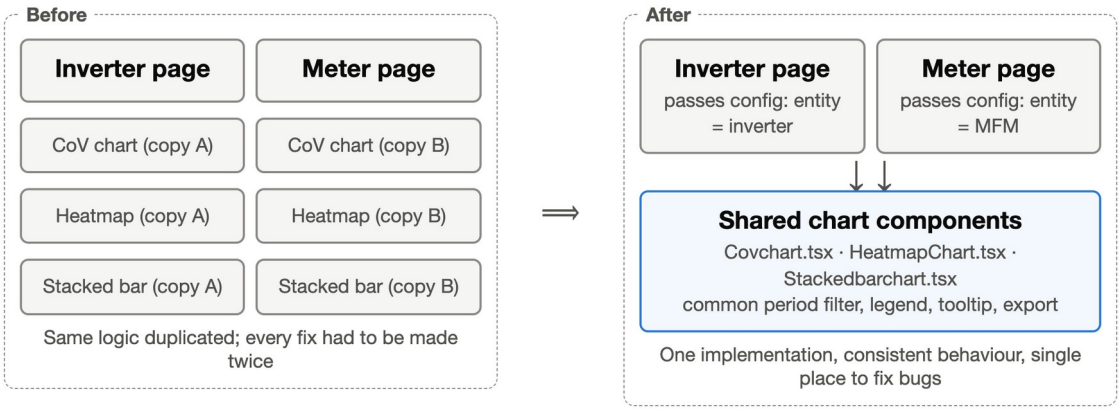

Figure 6: Refactoring duplicated chart implementations into shared components

3.7 System Information, Admin and Alarms (Weeks 9–13)

During July I worked on the operational views of the portal. The **System Information** view presents per-site time series – on-site irradiance sensor, clear-sky GHI, meter and inverter AC power, and export-meter energy – with consistent column names, units and Excel export. The **Admin** user-management view lists users with their role, client, status, pending-setup flag and last login, and supports an Excel snapshot of the user list. The **alarm views** show KPI-based alarms such as 'Full Site PR: Corridor Deviation' with severity, category, description and a recommended action, and an Alarm History export. Because these views contain personal and client data, exports were tested only with internal accounts and no data from them is reproduced in this report.

3.8 Spatial Heatmap – PV Healthscan (Weeks 13–16)

The Spatial Heatmap (marketed as PV Healthscan) overlays yield deviation of each inverter or string block on the satellite image of the plant, so that under-performing areas are visible at a glance and cleaning or maintenance can be prioritised. I completed the interactive version of this view:

- Responsive map container sized to the screen, consistent spacing between title, colour bar and map, and a pan icon on the graph.
- Conditional zoom rules so that sites of very different sizes are framed correctly; fixed an unwanted zoom when switching to the deviation view on some sites.
- Scrollable ranking list ordered from best to worst, with sites or devices that have no data still listed as N/A.

- Legend renaming logic with the full name available in tooltips; deviation shown with one decimal; refined colour scaling and statistics.
- Overlays and labels hidden on demand to see the underlying satellite image.

3.9 PR Evolution Corridor and Historical Averages (Weeks 14–15)

I fixed the Net PR corridor calculation and updated the PR Evolution chart to show the corridor and historical averages correctly. On the device-level PR graph, the lifetime average line is also drawn when multiple inverters or meters are selected, with its value in the legend. Chart styling (tick boxes, legend font size and weight, dropdown sizing) was aligned with the CoV chart so that all monitoring views look the same.

3.10 Raw Data, Reference Sensors and SolarGIS (Weeks 14–16)

The Raw Data view lets engineers download aligned time series for any combination of components. This part of the work was mostly backend:

- **AC Power / AC Energy exclusivity** – a series is requested either as power or as energy, avoiding mixed and misleading columns.
- **Mixed-resolution granularity detection** – when components log at different intervals (e.g. 5-minute and 15-minute), the resolution is detected and the series are aligned on a common time axis.
- **Reference sensor support** – each component can be tagged to a reference irradiance sensor (stored as a dictionary keyed by component id); the result carries a ref_sensor column. If the tag is not the component's own sensor, only the ground-type sensor is used.
- **Batched external sensor resolution** – some sites use a sensor installed at a neighbouring site. Instead of one query per sensor, internal and external sensors are grouped and resolved in batches, which also fixed errors on multi-site sensor setups.
- **SolarGIS** – dynamic granularity for satellite irradiance and support for plants with modules in multiple orientations.
- **Parallel queries and caching** – meter, inverter, sensor and SolarGIS series are fetched concurrently and cached, reducing response time for large date ranges.

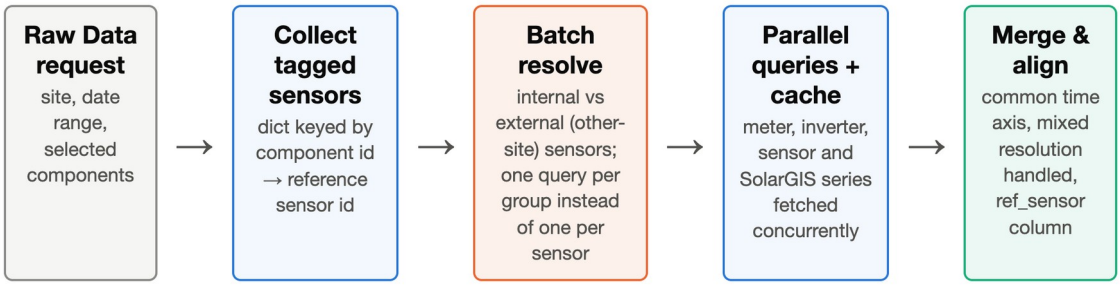

Figure 7: Raw-data request flow with batched reference-sensor resolution

3.11 Backend Refactoring and Automated Tests (Week 17)

My pull request for the monitoring routes had grown to more than 700 lines. Following review feedback, I refactored it to 289 lines – about 59 % smaller – by removing duplicated query construction, extracting helper functions and keeping only the functionality that was required. I also added automated API tests for the auth and files routes and test files covering the contact, health, preference and stats modules, so that future changes can be verified automatically.

3.12 Support Widget Requirements (Week 17)

At the end of the internship I analysed the requirements for an in-portal support feature: replacing the top-bar support icon with a floating bubble at the bottom right, a pop-up that routes solar-performance questions to the Performance Engineering team and portal questions to Smart O&M IT, separate WhatsApp and call buttons, and redirecting users who click a locked feature to the support page with an explanatory hover message. These notes were handed over to the team.

CHAPTER 4
SCREENSHOTS

The screenshots below were taken from the public demo account of portal.pv.doctor (October 2026). The demo uses anonymised sites ("Site Code 1–7"), so no client data is shown. Each figure is a module I built or worked on during the internship; the relevant section of Chapter 3 is given in brackets.

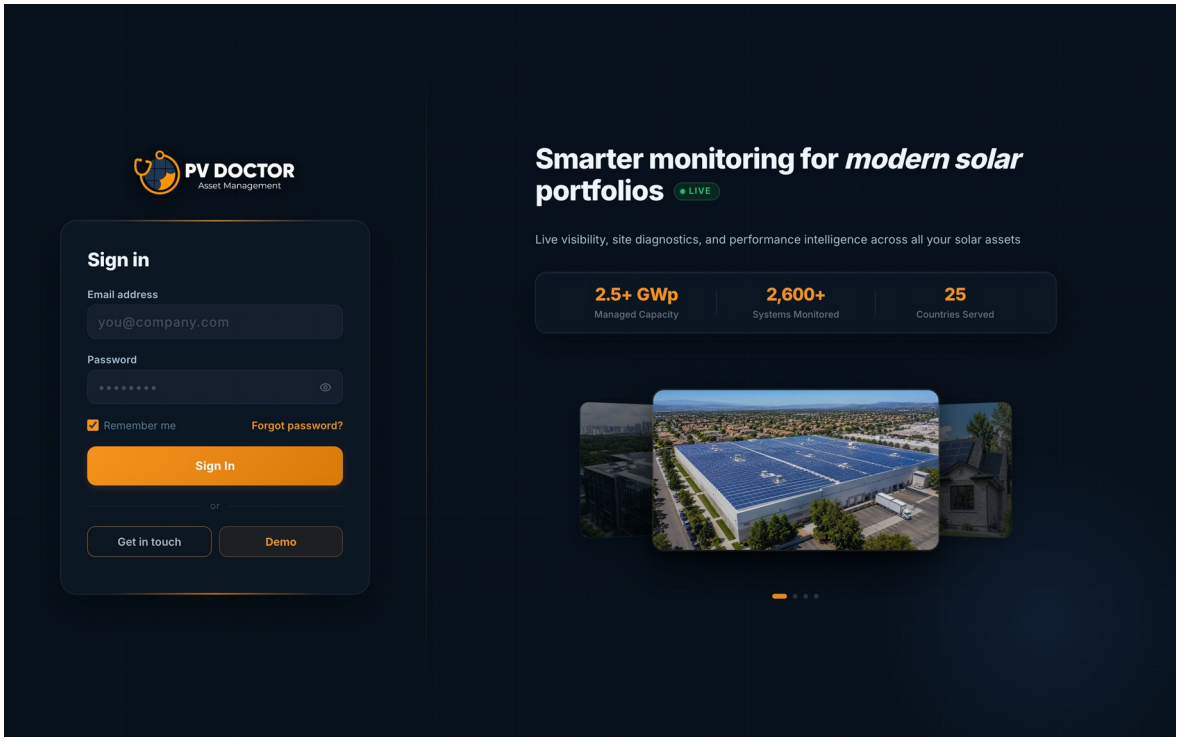

Figure 8: Smart O&M Portal – login page with demo access

The public entry point of the portal. The Demo button opens a read-only demo account; demo accounts hide sensitive sections (Section 3.3).

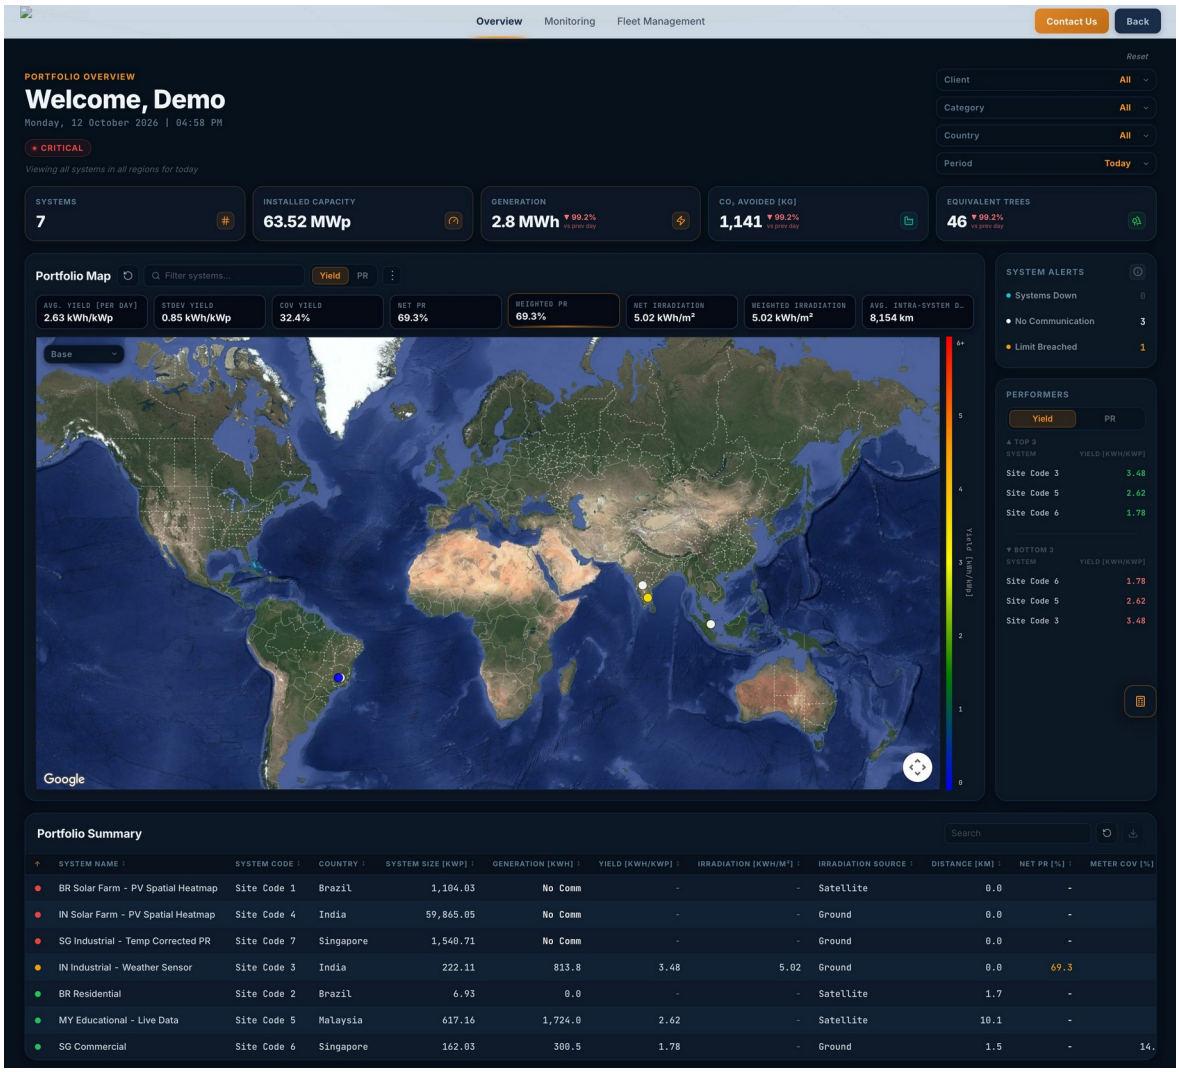

Figure 9: Portfolio Overview – KPI cards, portfolio map, system alerts, top/bottom performers and portfolio summary

Map auto-fit for selected systems, Reset that clears all state, Yield/PR toggle, decimal formatting and the Excel/PNG export menu (Section 3.3).

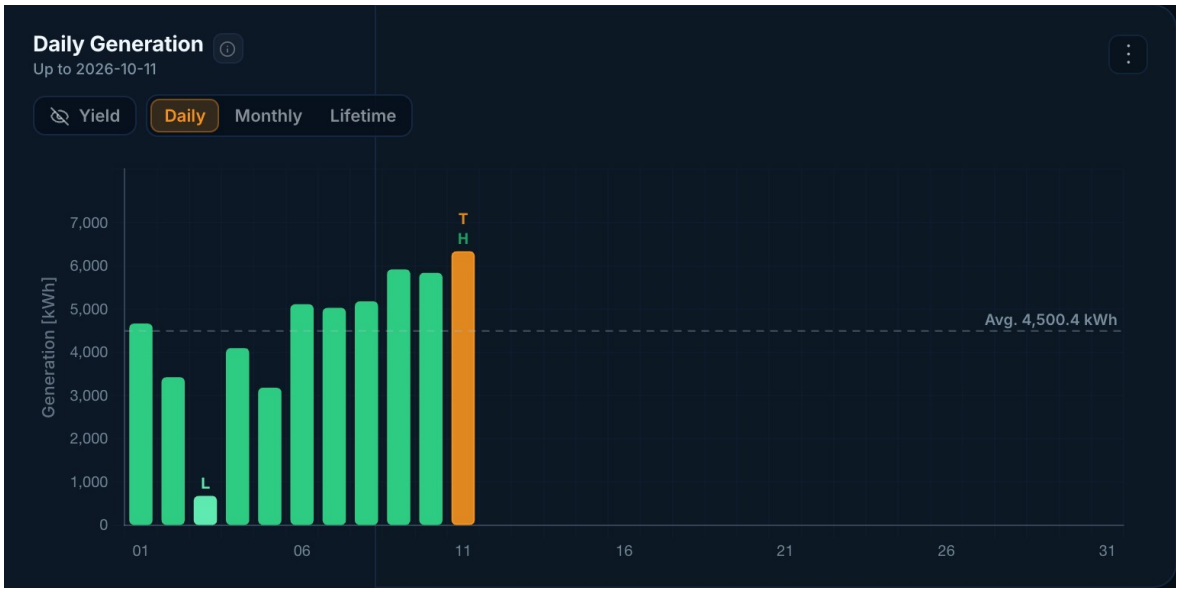

Figure 10: Plant Monitoring – Daily Generation with average line and highest/lowest markers

Generation plotted in kWh, Daily / Monthly / Lifetime toggles, buffer above the tallest bar, the dashed average line, and the three-dot download menu (Section 3.2).

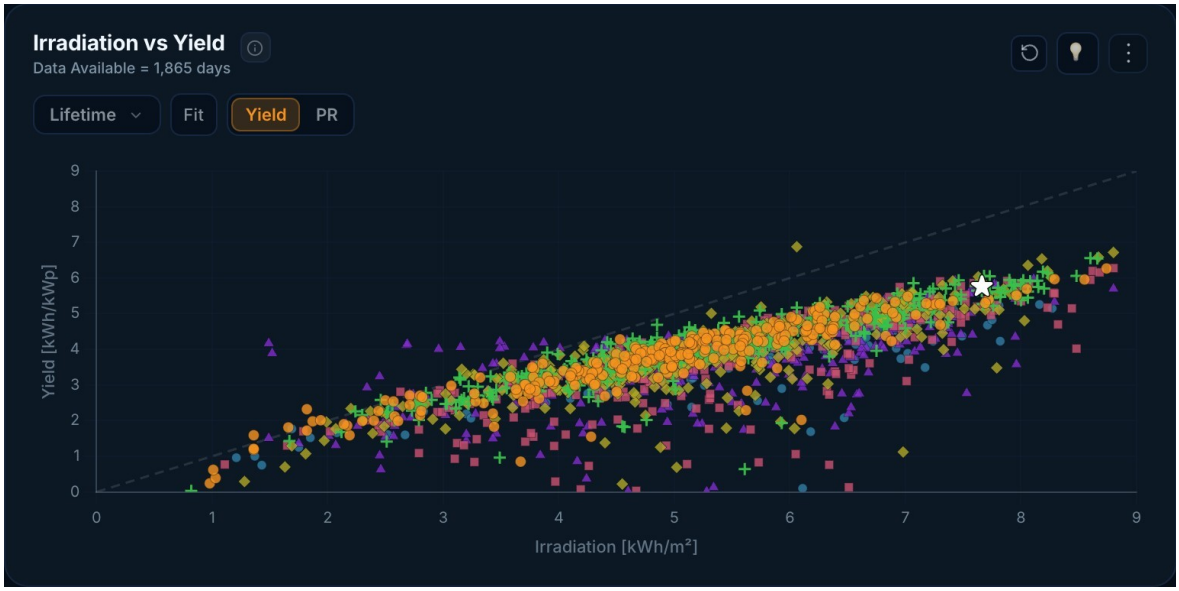

Figure 11: Plant Monitoring – Irradiation vs Yield scatter with year-wise colouring and fit line

The x-axis is limited to 9, units are kWh/m² and kWh/kWp, and the Lifetime/Fit/Yield/PR controls and the star marking the latest day come from the Week 1–2 revisions (Section 3.2.3).

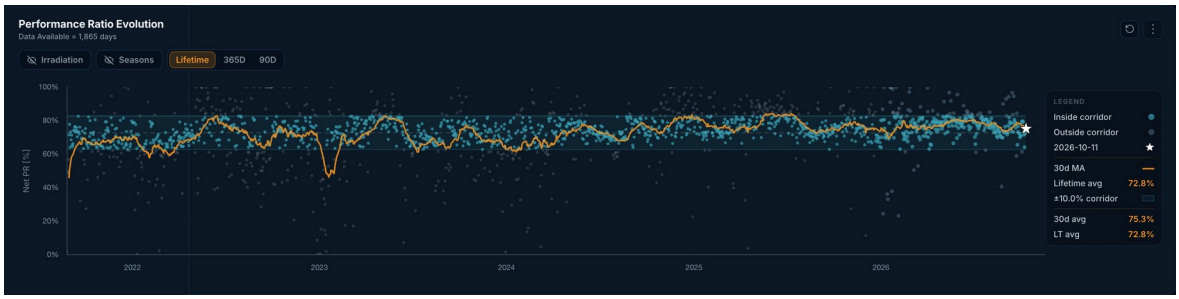

Figure 12: Performance Ratio Evolution – corridor (±10 %), 30-day moving average and lifetime average

Points inside and outside the corridor are coloured differently, the moving average is drawn above the scatter, 'Data Available = x days' is shown, and zoom is restricted to the X-axis (Sections 3.2.4, 3.4 and 3.9).

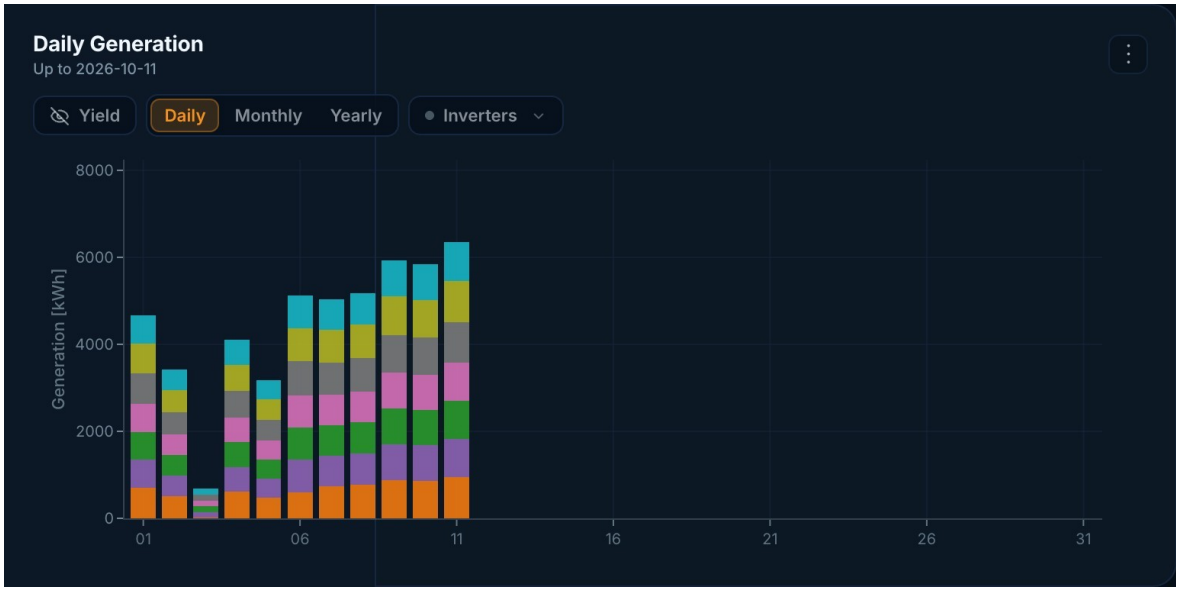

Figure 13: Inverter monitoring – stacked Daily Generation per inverter (G2) with inverter multi-select

The shared Stacked Bar component, refactored from two copies, with the multi-select Inverters filter (Sections 3.5 and 3.6).

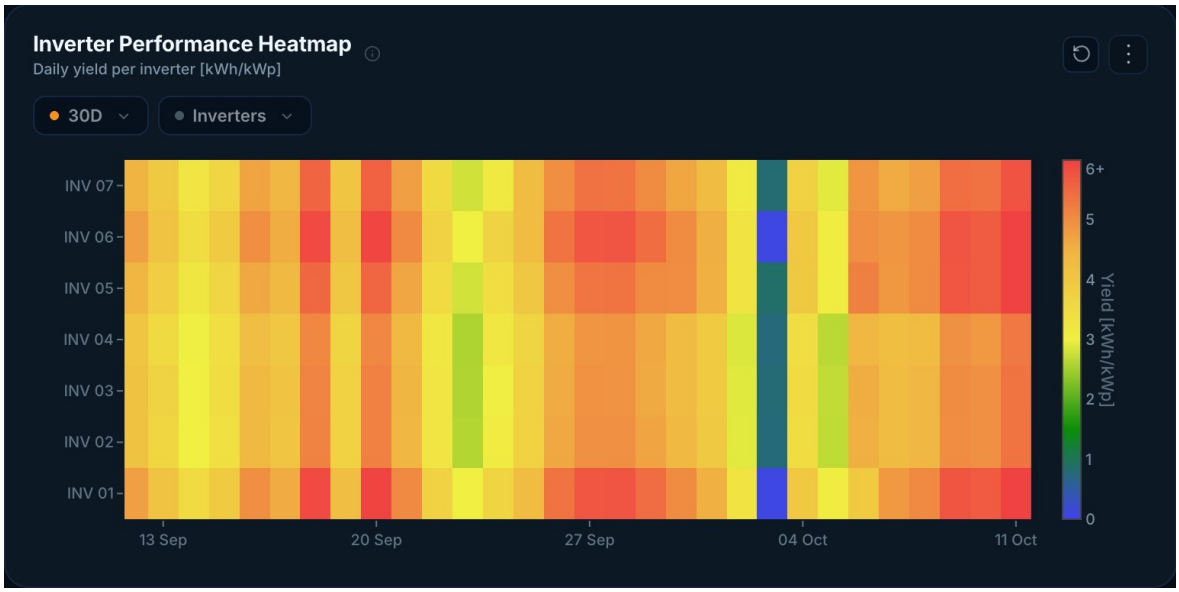

Figure 14: Inverter Performance Heatmap – daily yield per inverter over 30 days

The shared Heatmap component aligned with its colour bar and threshold scale (Sections 3.5 and 3.6).

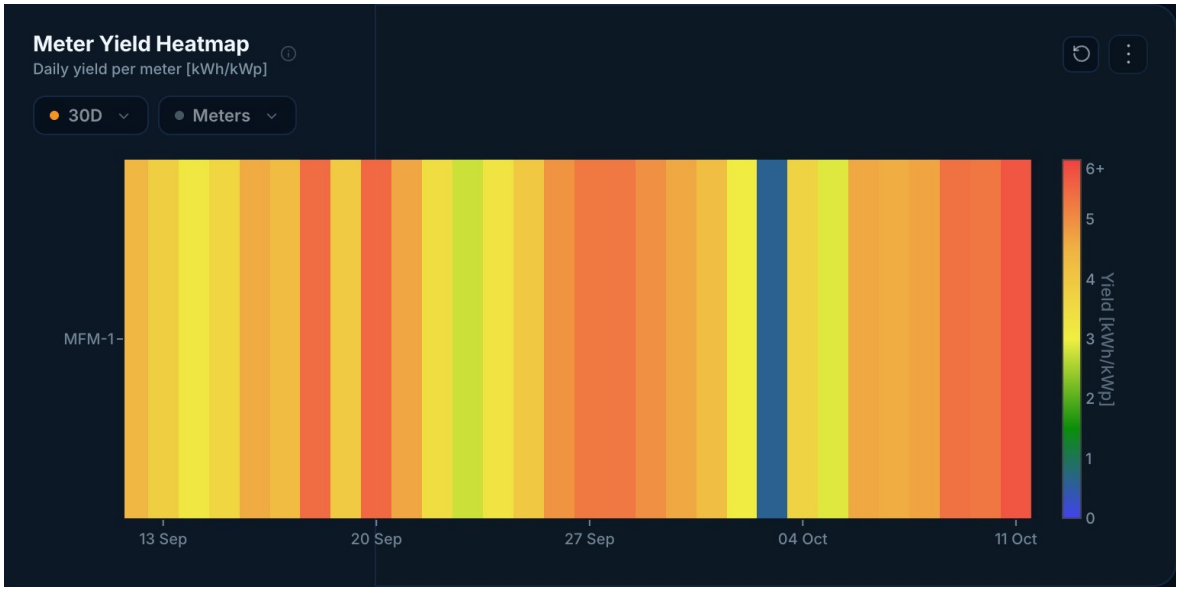

Figure 15: Meters & Zones – Meter Yield Heatmap built from the same shared component

The same Heatmap component reused for energy meters (MFMs), which keeps the two pages consistent (Section 3.6).

Figure 16: Specific Yield per inverter – Lifetime / 365D / 90D views with base-inverter selection

Period toggles and filters follow the period rules in Table 7 (Section 3.4).

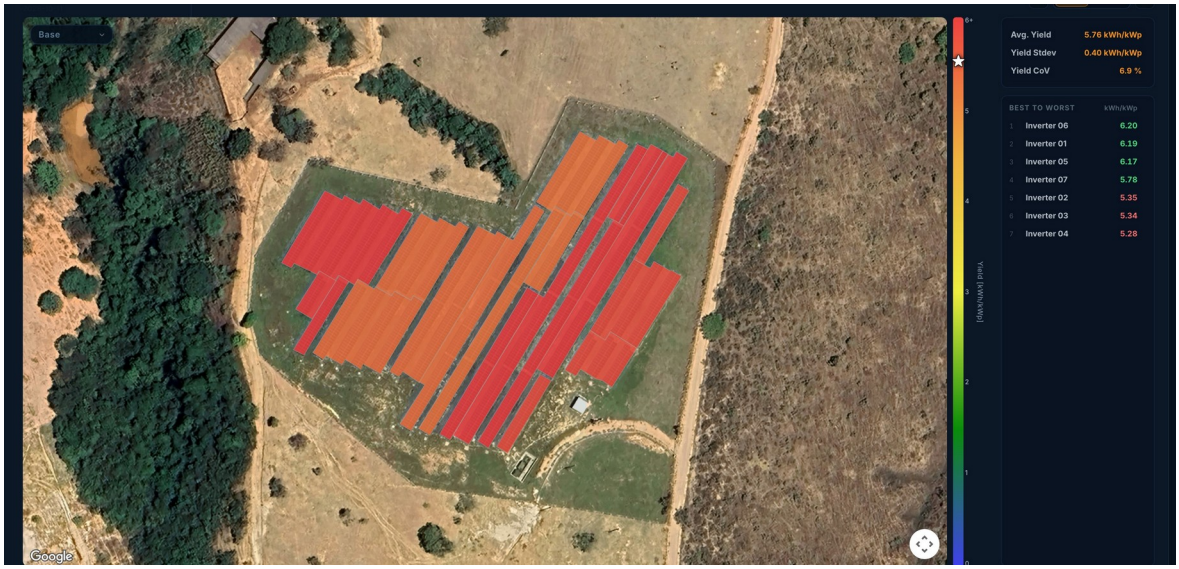

Figure 17: PV Spatial Heatmap (PV Healthscan) – inverter yield on the satellite layout with best-to-worst ranking

The interactive Spatial Heatmap: yield statistics (average, standard deviation, CoV), best-to-worst list, colour bar with marker, and the recentre control (Section 3.8).

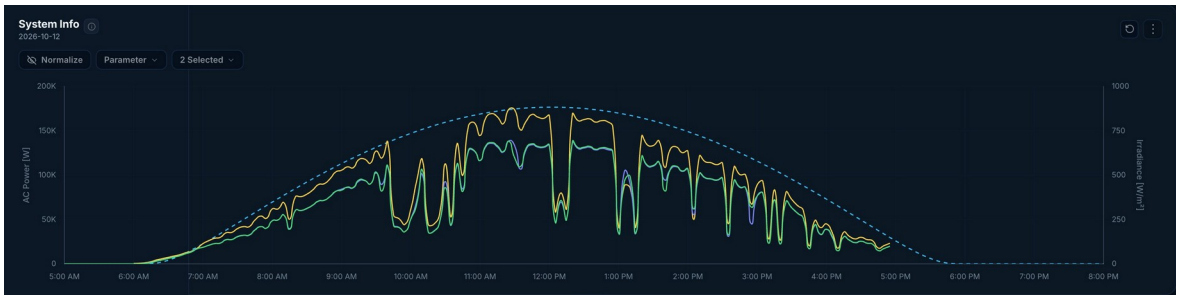

Figure 18: System Information – intraday AC power against clear-sky profile

The System Information time series connected to the Period Filter (Sections 3.4 and 3.7).

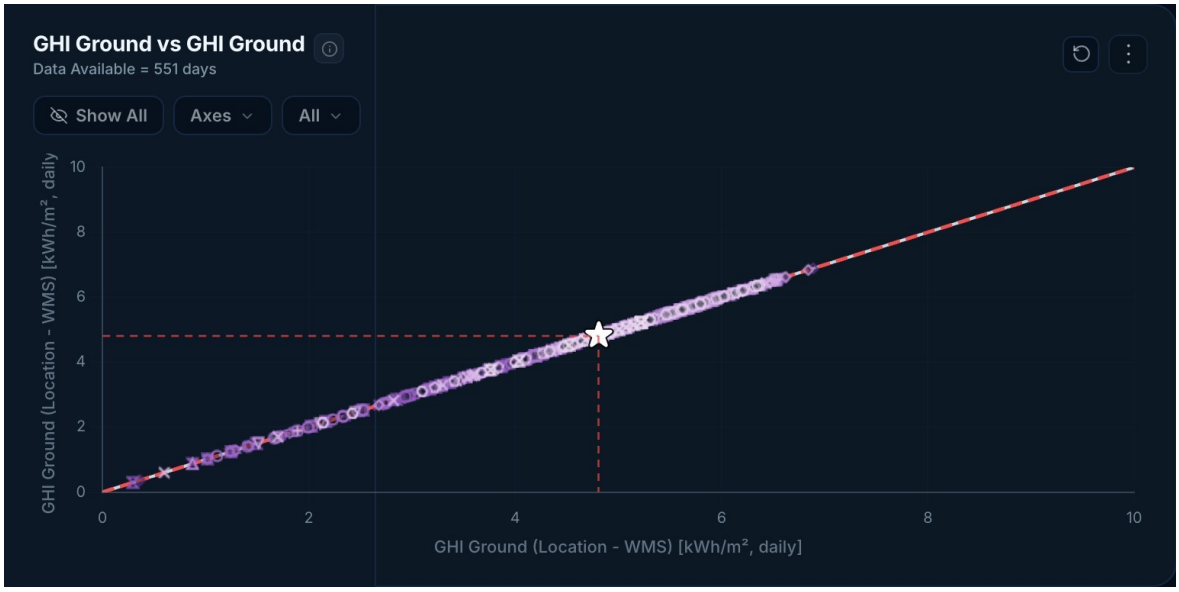

Figure 19: Weather Trends – comparison of ground irradiance sensors

Sensor-against-sensor comparison, related to the reference-sensor work in Raw Data (Section 3.10).

CHAPTER 5
RESULTS AND DISCUSSIONS

5.1 Results

The work was delivered as a series of reviewed pull requests that were verified on staging and released to the production portal. Table 8 summarises the main outcomes.

Table 8: Summary of results

Area	Outcome
Plant Monitoring	Four core charts brought to production quality: correct units and precision, year filters, regression, corridor colouring, playback and screenshot export.
Portfolio Overview	Map auto-fit, reliable Reset, Excel/PNG export, demo-account visibility rules and responsive KPI cards.
Period filter	One documented set of rules (Table 7) applied across charts; fixed month/year visibility and aggregation bugs.
Inverter / MFM	Multi-select filters with reset; consistent styling with Plant Monitoring; improved heatmap, CoV and Yield–PR charts.
Code quality	CoV, Heatmap and Stacked Bar charts consolidated from two copies each into shared components.
Spatial Heatmap	Interactive PV Healthscan view completed with ranking list, zoom rules and refined scaling.
Raw Data backend	Reference-sensor support, batched external sensor resolution, SolarGIS granularity and orientations, parallel queries with caching.
Backend refactor	Monitoring pull request reduced from 700+ to 289 lines (≈59 % smaller) with the same required behaviour.
Testing	Automated API tests added for auth and files plus contact, health, preference and stats modules.

5.2 Discussion

Correctness before decoration. The most important changes were often small: a wrong unit, an off-by-one in a date range, or a decimal rounding issue. Because O&M engineers act on these numbers, fixing them had more value than adding new visual features. Writing the period rules down as a table (Table 7) turned a stream of individual bug reports into one consistent behaviour.

Iterative review. Most features went through two to four review rounds. Early in the internship this felt slow, but it produced a consistent product and taught me to anticipate questions – such as how a chart behaves for a single day, a single year or a site with only one inverter – before submitting work.

Reducing duplication pays back quickly. After the chart refactor, later fixes (for example to legends and scrollbars in August) were made once instead of twice. Similarly, shrinking the backend pull request made it reviewable and easier to maintain.

Performance on real data. Sites with many devices and long histories produce large queries. Batching sensor resolution, running independent queries in parallel and caching results were necessary to keep the Raw Data view responsive.

5.3 Challenges Faced

Table 9: Challenges and how they were handled

Challenge	How it was handled
Learning a new domain (PV performance) quickly	Studied IEC 61724 KPIs and asked the team to explain each chart's purpose before changing it.
Large existing codebase	Read the existing component and its API before each change; kept changes small and focused.
Date and time-zone edge cases	Built a test matrix of period selections (Today, CM, LY, LT, custom ranges) and checked each chart against it.
Remote collaboration across time zones	Written updates in the task tracker, clear pull-request descriptions and screenshots for reviewers.
Site-specific data issues	Reproduced using the affected site's data, then generalised the fix (e.g. multi-site reference sensors).
Balancing internship with semester start (August)	Moved to a fixed part-time schedule of about 4 hours per day.

CHAPTER 6
CONCLUSIONS AND FUTURE SCOPE

6.1 Conclusion

During the 17-week internship at PV Doctor Pte. Ltd. I contributed to a production web application that helps solar asset owners and O&M engineers monitor more than 2.5 GWp of PV capacity. I built and refined the portal's main visualisations, made date and period handling consistent, refactored duplicated chart code into shared components, completed the interactive Spatial Heatmap, extended the FastAPI backend for raw data, reference sensors and satellite irradiance, and added automated tests.

The internship met the objectives set in Chapter 1. Beyond the technical skills – React, Next.js, TypeScript, Chart.js, Plotly, FastAPI and SQL – I learned how professional teams work: tasks in Jira, small reviewed pull requests, staging before production, and careful handling of confidential client data. I also gained an understanding of how good software directly increases clean-energy output by helping engineers find faults sooner.

6.2 Future Scope

- **Automated anomaly detection** – use machine-learning models on PR and CoV time series to detect soiling, shading and inverter faults earlier than fixed corridors.
- **Root-cause suggestions** – combine alarms with weather and device data to suggest the likely cause and recommended action automatically.
- **Front-end test coverage** – add component and end-to-end tests for chart and filter behaviour so that the period rules are verified on every change.
- **Support widget** – implement the in-portal support bubble and routing analysed in week 17.
- **Mobile experience and notifications** – a mobile-first view and WhatsApp/e-mail alerts for owners of small systems who do not use dashboards.
- **Performance** – pre-aggregated summaries and server-side caching for very large portfolios.

WEEKLY JOBS SUMMARY

Weeks 1–13 were full-time; weeks 14–17 were part-time (about 4 hours per day). Detailed weekly logbooks in the prescribed format are in Appendix D.

Table 10: Weekly jobs summary

Wk	Dates	Jobs / tasks performed
1	05–08 May 2026	Onboarding to the Data Engineering & Analytics team; Jira and repository access; local setup of the Next.js frontend and FastAPI backend; study of PV KPIs. First chart fixes: download menu, zoom limits, tooltips, units.
2	11–15 May 2026	Plant Monitoring chart revisions: tooltip styling, units and precision, year filter, regression line, yield playback and screenshot effect. Portfolio Overview: map auto-fit, download option, cleaner reset and search.
3	18–22 May 2026	Inverter page made consistent with Plant Monitoring; heatmap legend and threshold revisions; fixed PR Evolution layering, Daily Generation defaults, corridor lines and moving-average styling.
4	25–29 May 2026	Fixed tooltip and map cut-offs; default map shows whole portfolio; Excel and PNG export of the map overview; 'Data Available' indicator and consistent legends and hover behaviour.
5	01–05 Jun 2026	On leave 2–4 June. Standardised Reset button and period labels (CM, LT, LY); fixed month/year visibility bugs in Daily Generation and Hindsight; monthly aggregation for multi-year ranges.
6	08–12 Jun 2026	On leave 10–12 June. Added multi-select inverter/MFM filters with reset and auto-width; aligned G2 grid and border styling; regression testing of monitoring views.
7	15–19 Jun 2026	On leave 15 June. Defined date/filter rules for Heatmap and CoV; fixed Yield–PR axes and z-order; Portfolio Overview reset now clears map state; demo-account visibility rules.
8	22–26 Jun 2026	Year/Day toggle for Yield–PR; refactored Heatmap, CoV and Stacked Bar into shared components; connected System Information to the Period Filter with backend access changes.
9	29 Jun – 03 Jul 2026	Fixed filter and data-fetch logic for a site with an unusual configuration; improved responsive layout and KPI breakpoints for smaller screens.
10	06–10 Jul 2026	Admin user-management view with user list and Excel export; prepared visuals for the public demo page.
11	13–17 Jul 2026	System Information page: sensor, meter and inverter time series with consistent names, units and Excel export.
12	20–24 Jul 2026	Alarm views: severity colours, categories and recommended actions, consistent with the Portfolio Overview alert panel.
13	27–31 Jul 2026	Alarm History export; validated PR corridor-deviation alarms; planned Spatial Heatmap work. Internship extended into August (part-time).

Wk	Dates	Jobs / tasks performed
14	03–07 Aug 2026	Part-time (~4 h/day). Spatial Heatmap layout; AC power/energy handling in Raw Data; Net PR corridor fix; shared date handling; mixed-resolution data; dynamic SolarGIS granularity.
15	10–14 Aug 2026	Spatial Heatmap statistics, ranking list and zoom fixes; PR Evolution corridor and historical averages; reference sensors in Raw Data; changes integrated into staging.
16	17–21 Aug 2026	Batched external reference-sensor resolution; multi-site sensor fixes; multi-orientation SolarGIS; parallel raw-data queries with caching.
17	24–31 Aug 2026	Refactored the monitoring pull request from 700+ to 289 lines; added automated API tests; analysed support-widget requirements; handover.

LEARNING OUTCOME AFTER TRAINING

Technical Learning

- Building production-quality React components in Next.js with TypeScript, including state management with hooks and context.
- Data visualisation with Chart.js and Plotly.js: scales, time axes, zoom and pan, tooltips, layering, colour for categories and time, and export to image and Excel.
- Designing consistent date-range and aggregation logic and testing it systematically.
- Developing REST APIs in FastAPI, writing efficient SQL access with batching, parallel queries and caching, and writing automated API tests.
- Refactoring for maintainability: removing duplication, extracting shared components and keeping pull requests small.
- Solar PV performance analysis: yield, irradiation, PR, CoV, corridors and the role of satellite irradiance.

Professional Learning

- Working in a remote, international team with written communication, task trackers and code review.
- Taking ownership of a feature from requirement to release, including staging verification.
- Handling confidential client data responsibly.
- Managing time between internship work and academic commitments.

Mapping to Course Outcomes (ES-453)

Table 11: Mapping of internship work to ES-453 course outcomes

CO	Course outcome	How it was achieved
CO1	Analyze and understand real-world IT problems through internship tasks.	Analysed user-reported issues in charts, filters and data queries of a live monitoring portal.
CO2	Design or assist in implementing solutions using specific technologies.	Designed and implemented chart components, period rules, raw-data APIs and refactors (Web Development, data engineering).
CO3	Use tools, platforms or frameworks relevant to the domain efficiently.	Next.js, React, TypeScript, Chart.js, Plotly, FastAPI, SQL Server, Git, Jira, Nginx.

CO	Course outcome	How it was achieved
CO4	Prepare comprehensive technical reports and presentations.	Weekly task tracker entries, pull-request descriptions, this report and the viva presentation.

APPENDIX D – WEEKLY LOGBOOKS (WEEKS 1–17)

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
DEPARTMENT OF INFORMATION TECHNOLOGY
WEEKLY SUMMER INTERNSHIP / TRAINING REPORT

7th Semester – ES-453 | Academic Session 2026–27

Week No.: 1 Dates: From 05 May 2026 to 08 May 2026

Student Information	**Details**	**Training / Course Information**	**Details**
Name	Ishan Bhattacharya	Organization Name	PV Doctor Pte. Ltd.
Roll No.	08514803123	Contact Person (Mentor/HR)	Mr. Manav Gupta
Batch / Section	7-I-4 (IT – AIML)	Designation	Head of Data Engineering & Analytics
Semester	7th	Contact No. & Email	+91 97175 20052
Project / Domain Name	Web Development & Data Visualisation – Solar PV Smart O&M Monitoring Portal	Faculty Counsellor Name	Sunil Maggu

A. Application of Technical Knowledge and Skills

☑ Applied classroom knowledge to assigned tasks
☑ Used industry-standard tools/software
☑ Completed assigned technical tasks successfully
☑ Learned new technical concepts/technologies

B. Problem Solving and Learning Ability

☑ Identified technical/operational problems
☑ Analyzed and proposed solutions
☑ Resolved assigned issues/tasks
☑ Acquired new knowledge or skills during the week

C. Professionalism, Teamwork, and Communication

☑ Maintained regular attendance and punctuality
☑ Worked effectively with team members
☑ Communicated effectively with mentor/supervisor
☑ Completed assigned work within deadlines

D. Internship Progress, Documentation, and Reflection

☑ Updated weekly logbook/documentation
☑ Submitted reports/records on time
☑ Reflected on learning outcomes achieved
☑ Defined objectives for the next week

Weekly Progress Summary (Brief)

Major Activities Completed: Onboarding to the Data Engineering & Analytics team; Jira and repository access; local setup of the Next.js frontend and FastAPI backend; study of PV KPIs. First chart fixes: download menu, zoom limits, tooltips, units.

Key Learning Outcomes Achieved: Architecture of a production Next.js + FastAPI portal; solar KPIs and their units; Chart.js configuration, zoom plugin and tooltip callbacks.

Plan for Next Week: Complete review comments on Plant Monitoring graphs; add year filters, regression line and playback.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 08 May 2026

Industry Mentor / Research Supervisor Remarks: Good start; onboarded quickly and picked up the codebase.

Signature: _____ Name: Mr. Manav Gupta Date: 08 May 2026

Weekly Progress Summary (Brief)

Major Activities Completed: Plant Monitoring chart revisions: tooltip styling, units and precision, year filter, regression line, yield playback and screenshot effect. Portfolio Overview: map auto-fit, download option, cleaner reset and search.

Key Learning Outcomes Achieved: Designing readable charts (units, precision, colour for time); handling canvas capture for screenshots and animated playback; working through review feedback in iterations.

Plan for Next Week: Make Inverter page consistent with Plant Monitoring; heatmap legend and threshold revisions.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 15 May 2026

Industry Mentor / Research Supervisor Remarks: Chart revisions done well; responsive to review comments.

☑ Reflected on learning outcomes achieved
☑ Defined objectives for the next week

Weekly Progress Summary (Brief)

Major Activities Completed: On leave 15 June. Defined date/filter rules for Heatmap and CoV; fixed Yield–PR axes and z-order; Portfolio Overview reset now clears map state; demo-account visibility rules.

Key Learning Outcomes Achieved: Rule tables for UI state; React state synchronisation between filters and map; role-based visibility for demo users.

Plan for Next Week: Year/Day toggle for Yield–PR; refactor duplicated chart code.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 19 June 2026

Industry Mentor / Research Supervisor Remarks: Clear date/filter rules defined; good work.

Signature: _____ Name: Mr. Manav Gupta Date: 19 June 2026

Appendix D – Weekly Logbooks – Week 8

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
DEPARTMENT OF INFORMATION TECHNOLOGY
WEEKLY SUMMER INTERNSHIP / TRAINING REPORT

7th Semester – ES-453 | Academic Session 2026–27

Week No.: 8 Dates: From 22 June 2026 to 26 June 2026

Student Information	**Details**	**Training / Course Information**	**Details**
Name	Ishan Bhattacharya	Organization Name	PV Doctor Pte. Ltd.
Roll No.	08514803123	Contact Person (Mentor/HR)	Mr. Manav Gupta
Batch / Section	7-I-4 (IT – AIML)	Designation	Head of Data Engineering & Analytics
Semester	7th	Contact No. & Email	+91 97175 20052
Project / Domain Name	Web Development & Data Visualisation – Solar PV Smart O&M Monitoring Portal	Faculty Counsellor Name	Sunil Maggu

A. Application of Technical Knowledge and Skills

☑ Applied classroom knowledge to assigned tasks
☑ Used industry-standard tools/software
☑ Completed assigned technical tasks successfully
☑ Learned new technical concepts/technologies

B. Problem Solving and Learning Ability

☑ Identified technical/operational problems
☑ Analyzed and proposed solutions
☑ Resolved assigned issues/tasks
☑ Acquired new knowledge or skills during the week

C. Professionalism, Teamwork, and Communication

☑ Maintained regular attendance and punctuality
☑ Worked effectively with team members
☑ Communicated effectively with mentor/supervisor
☑ Completed assigned work within deadlines

D. Internship Progress, Documentation, and Reflection

☑ Updated weekly logbook/documentation
☑ Submitted reports/records on time
☑ Reflected on learning outcomes achieved
☑ Defined objectives for the next week

Weekly Progress Summary (Brief)

Major Activities Completed: Year/Day toggle for Yield–PR; refactored Heatmap, CoV and Stacked Bar into shared components; connected System Information to the Period Filter with backend access changes.

Key Learning Outcomes Achieved: Refactoring to remove duplication without changing behaviour; backend changes in FastAPI; testing across user roles.

Plan for Next Week: Responsive layout for smaller screens; filter fixes for specific sites.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 26 June 2026

Industry Mentor / Research Supervisor Remarks: Refactoring reduced duplicate code; well tested.

Signature: _____ Name: Mr. Manav Gupta Date: 26 June 2026

☑ Defined objectives for the next week

Weekly Progress Summary (Brief)

Major Activities Completed: Alarm views: severity colours, categories and recommended actions, consistent with the Portfolio Overview alert panel.

Key Learning Outcomes Achieved: How KPI-based alarms (e.g. PR corridor deviation) are generated and shown to O&M teams.

Plan for Next Week: Alarm History export; start PR Evolution corridor and Spatial Heatmap work.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 24 July 2026

Industry Mentor / Research Supervisor Remarks: Alarm views consistent with portal design.

Weekly Progress Summary (Brief)

Major Activities Completed: Alarm History export; validated PR corridor-deviation alarms; planned Spatial Heatmap work. Internship extended into August (part-time).

Key Learning Outcomes Achieved: End-to-end flow from a KPI rule to an alarm record and export.

Plan for Next Week: Spatial Heatmap layout, Raw Data and PR corridor calculations (part-time from August).

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

Student Signature: Ishan Bhattacharya Date: 31 July 2026

Industry Mentor / Research Supervisor Remarks: Good progress; continuing part-time in August.

Weekly Progress Summary (Brief)

Major Activities Completed: Part-time (~4 h/day). Spatial Heatmap layout; AC power/energy handling in Raw Data; Net PR corridor fix; shared date handling; mixed-resolution data; dynamic SolarGIS granularity.

Key Learning Outcomes Achieved: Combining data series of different time resolutions; satellite irradiance (SolarGIS) as a reference.

Plan for Next Week: Spatial Heatmap statistics, PR Evolution filters and staging integration.

Verification

Student Self-Validation: I certify completion of this week's modules honestly.

7th Semester – ES-453 | Academic Session 2026–27

DEPARTMENT OF INFORMATION TECHNOLOGY

Employer Feedback Form

(Industry Mentor / Research Supervisor Feedback Form)

Academic Session 2026–27

Dear Industry Mentor / Research Supervisor,

Thank you for supporting our Programme by offering an Industrial Training placement. It represents an important part of our students' professional training. To complete the process, we would appreciate it if you would complete this short assessment of the student.

Student Information / Industry Information

Student Information	**Industry Information**
Name: Ishan Bhattacharya	Organization Name: PV Doctor Pte. Ltd.
Roll No.: 08514803123	Contact Person (Mentor/HR): Mr. Manav Gupta
Batch / Section: 7-I-4 (IT – AIML)	Designation: Head of Data Engineering & Analytics
Semester: 7th	Contact No. & Email: +91 97175 20052

Performance & Behavioural Assessment

Please check (✓) the box that best reflects the intern's traits during their tenure.

Evaluation Parameters	**Excellent**	**Good**	**Satisfactory**	**Poor**
Attendance & Punctuality	☐	☑	☐	☐
Technical Agility (Ability to learn and apply new skills)	☑	☐	☐	☐
Professional Decorum (Workplace ethics and discipline)	☑	☐	☐	☐
Teamwork & Collaboration (Communication with peers)	☐	☑	☐	☐
Quality of Output (Accuracy and completion of tasks)	☐	☑	☐	☐

Final Validation & Comments

Parameter	**Industry Mentor / Research Supervisor Response**
Core Skills / Tools Used:	React / Next.js, TypeScript, Chart.js, Plotly.js, FastAPI, SQL Server, Git
Overall Performance Grade:	☐ Outstanding ☑ Good ☐ Average ☐ Poor
Internship Status:	☑ Completed Successfully ☐ Unsuccessful / Terminated
Major Strengths:	Learns new tools quickly; careful attention to UI detail and data correctness; responds well to review feedback; took ownership of chart and raw-data features.
Areas for Improvement:	Break large changes into smaller pull requests from the start and write automated tests alongside new features.

Signature of Industry Mentor: _____ Name: Mr. Manav Gupta Date: 31 August 2026

APPENDIX G – STUDENT FEEDBACK FORM

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY

7th Semester – ES-453 | Academic Session 2026–27

DEPARTMENT OF INFORMATION TECHNOLOGY

STUDENT FEEDBACK FORM: INTERNSHIP

Academic Session 2026–27

Student Information / Industry Information

Student Information	Industry Information
Name: Ishan Bhattacharya	Organization Name: PV Doctor Pte. Ltd.
Roll No.: 08514803123	Contact Person (Mentor/HR): Mr. Manav Gupta
Batch / Section: 7-I-4 (IT – AIML)	Designation: Head of Data Engineering & Analytics
Semester: 7th	Contact No. & Email: +91 97175 20052

Experience Evaluation

Please check (✓) the box that best matches your experience.

S.No.	Evaluation Parameters	Excellent	Good	Satisfactory	Poor
1	Work Environment & Facilities	☐	☑	☐	☐
2	Support from Industry Mentor / Research Supervisor	☑	☐	☐	☐
3	Technical Learning & Exposure	☑	☐	☐	☐
4	Relevance to Your Branch	☑	☐	☐	☐

Key Learnings & Comments

Parameter	Student Response
Core Skills / Tools Learned:	1. React / Next.js with TypeScript 2. Chart.js & Plotly.js data visualisation 3. FastAPI & SQL Server
Recommend to Juniors?	☑ Yes ☐ No
Brief Comments / Feedback:	Worked remotely with the Data Engineering & Analytics team on a production solar-monitoring portal used by clients in over 20 countries. Every feature went through code review and staging, which taught me to write maintainable code and to test edge cases thoroughly.

Student's Signature: Ishan Bhattacharya **Date: 12 October 2026**

APPENDIX H – COURSE EXIT SURVEY

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
DEPARTMENT OF INFORMATION TECHNOLOGY
COURSE EXIT SURVEY

Academic Session: 2026-27

Course: Summer Training Report - 2 (ES-453) | Semester: 7th Semester

Please rate your level of skills and knowledge for each course outcome.

Rating Scale: 1 - Lowest, 2 - Low, 3 - Moderate, 4 - High, 5 - Highest

CO / Bloom Level	Course Exit Survey Statement	Rating
ES-453.1 **L2 - Understand**	Your ability to understand real-world IT problems, processes, and requirements encountered during internship or training.	☐1 ☐2 ☐3 ☑4 ☐5
ES-453.2 **L3 - Apply**	Your ability to apply appropriate technologies, tools, platforms, or frameworks to assigned real-world tasks or problems.	☐1 ☐2 ☐3 ☐4 ☑5
ES-453.3 **L4 - Analyze**	Your ability to analyze technical problems, results, and alternative approaches while working on real-world internship or training tasks.	☐1 ☐2 ☐3 ☑4 ☐5
ES-453.4 **L5 - Evaluate**	Your ability to evaluate the effectiveness of the work or solution developed and communicate your technical learning through a comprehensive report, presentation, and viva.	☐1 ☐2 ☐3 ☑4 ☐5

Suggestion(s) to improve the course:

Share the report templates and evidence checklist at the start of the summer so weekly logbooks can be signed as the internship progresses.

A short mid-internship review with the faculty counsellor would help remote interns align their work with the course outcomes early.

Name of the Student: Ishan Bhattacharya Enrollment No.: 08514803123

Signature: Ishan Bhattacharya Date: 12 October 2026

APPENDIX J – CO–PO / PSO MAPPING

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
DEPARTMENT OF INFORMATION TECHNOLOGY
CO–PO & PSO MAPPING

7th Semester – ES453 | Academic Session 2026–27

(To be submitted by the student and evaluated by the Faculty Counsellor)

Particulars	**Details**
Student Name	Ishan Bhattacharya
Roll Number	08514803123
Programme / Branch	B.Tech. / Information Technology
Semester	7th
Type of Training	☑ Industrial Internship ☐ Research Project ☐ SWAYAM/NPTEL Course
Training Duration & Mode	5 May 2026 to 31 August 2026 (17 weeks) – Remote / Work from Home
Project Title / Course Name	Design and Development of Interactive Data Visualisation Modules for a Solar PV Smart O&M Monitoring Portal
Faculty Counsellor	Sunil Maggu

COURSE OUTCOMES (COs) For 7th Semester ES453

CO #	**Course Outcome Statement**
CO1	Analyze and understand real-world IT problems through internship tasks or case studies.
CO2	Design or assist in implementing solutions using specific technologies such as AI/ML, Web Development, Cloud, or Networking.
CO3	Use tools, platforms, or frameworks relevant to the internship domain efficiently.
CO4	Prepare comprehensive technical reports and presentations adhering to professional standards.

CO–PO MAPPING MATRIX For 7th Semester ES453

Map each Course Outcome (CO) to Program Outcomes (POs) on a scale of: 1 = Low / Slight Correlation, 2 = Medium / Moderate Correlation, 3 = High / Substantial Correlation, or – = No Correlation.

COs	**PO1**	**PO2**	**PO3**	**PO4**	**PO5**	**PO6**	**PO7**	**PO8**	**PO9**	**PO10**	**PO11**
CO1	3	3	1	2	2	-	-	-	-	-	2
CO2	3	3	2	2	3	-	-	-	1	-	2
CO3	2	2	-	1	3	-	-	-	-	-	2
CO4	-	-	-	-	-	-	-	2	3	3	2
Average	2.7	2.7	2	2.5	2.5	-	-	2	2.5	3	2

CO–PSO MAPPING MATRIX

Map each Course Outcome (CO) to Program Specific Outcomes (PSOs):

COs	**PSO1**	**PSO2**	**PSO3**
CO1	2	2	1
CO2	2	3	2
CO3	3	2	2
CO4	-	1	2
Average	2.7	2.0	1.8

APPENDIX K – SDG MAPPING

MAHARAJA AGRASEN INSTITUTE OF TECHNOLOGY
DEPARTMENT OF INFORMATION TECHNOLOGY
SUSTAINABLE DEVELOPMENT GOALS (SDG) MAPPING

7 Semester – ES453 | Academic Session 2026–27

(To be submitted by the student and verified by the Faculty Counsellor)

Particulars	**Details**
Student Name	Ishan Bhattacharya
Roll Number	08514803123
Programme / Branch	B.Tech. / Information Technology
Semester	7
Type of Training	☑ Industrial Internship ☐ Research Project ☐ SWAYAM/NPTEL Course
Training Duration & Mode	5 May – 31 Aug 2026 (17 weeks), Remote
Project Title / Course Name	Design and Development of Interactive Data Visualisation Modules for a Solar PV Smart O&M Monitoring Portal
Organization / Institution	PV Doctor Pte. Ltd., Singapore
Faculty Counsellor	Sunil Maggu

Identify the Sustainable Development Goal(s) relevant to your project/course work and state the specific technical contribution or application.

Select (✓)	**Sustainable Development Goal (SDG)**	**Technical Justification / Practical Application in Project**
☐	SDG 1: No Poverty	
☐	SDG 2: Zero Hunger	
☐	SDG 3: Good Health and Well-being	
☐	SDG 4: Quality Education	
☐	SDG 5: Gender Equality	
☐	SDG 6: Clean Water and Sanitation	
☑	SDG 7: Affordable and Clean Energy	Built PR, yield, CoV and Spatial Heatmap analytics that help operators find under-performing PV plants and inverters faster, raising clean-energy output.
☐	SDG 8: Decent Work and Economic Growth	
☑	SDG 9: Industry, Innovation and Infrastructure	Contributed to scalable digital infrastructure for renewable-energy asset management (Next.js + FastAPI portal, shared components, optimised queries, tests).
☐	SDG 10: Reduced Inequalities	
☐	SDG 11: Sustainable Cities and Communities	
☐	SDG 12: Responsible Consumption and Production	
☑	SDG 13: Climate Action	Faster fault detection reduces lost solar generation replaced by fossil power; the portal reports CO_2 avoided per site.
☐	SDG 14: Life Below Water	
☐	SDG 15: Life on Land	
☐	SDG 16: Peace, Justice and Strong Institutions	
☐	SDG 17: Partnerships for the Goals
